Editorial

Today, the evolution of the discovering more knowledge and development of the technology in ambit of the nanotechnology^[1], establishes new paradigms and other interpretations on medical aspects and of the health that are necessary enlarge the research of new medical developments in disciplines as the quantum medicine^[2], integral medicine, nanomedicine and radionics medicine^[3], which interprets the health like an harmoniousness energy state of mind-body^[1], which requires an integral treatment and cure. This interpretation through certain postulates establishes a similitude and congruence with the Universe which is the space-time^[4]. This is corresponded to the mind-body, because all changes in the organisms are generated from the mind, and this is corresponded to the field of the space-time. Then we need processes and clinical methods of cure considering the elements of the Universe that are in abundance and available to us anyway, anywhere and anyhow^[5], that are the energy fields, particles, waves, field interactions and fine radiation, designing and constructing new biomedical devices or advanced pharmaceutical methods that can be even extensions of our vital field to correct it and alignment it^[6], as is the case of homeopathy that heals under the principle of similarity through the energy of plants. A fundamental principle coined over several years in nanomedicine and quantum medicine research is the fact that disease is a product of atomic collateral damage developed by an energy imbalance in the body^[2]. In most cases, if not all, the cause symptomatological happens first in the mind. Mono-pharmacists are developed to inhibit anxiety actions in the majority of patients with mental abnormalities^[7]. However, the development of quantum medicine has made it possible to have advanced mono-pharmacists that manage to create serotonin and balance the mind, which acts on the soma of the body and in this way the body can be cured^[8]. The medical solution to cure all illnesses and diseases is within our reach, and a small beam of fine photons^[9] which could be called "the ray of love", could cure all diseases under a same principle of energy.
